

SAMPLE DELIVERABLE

Requirements Clarity Pack

A polished requirements package that turns unclear scope, stakeholder notes, policy rules, and delivery questions into usable business, functional, and non functional requirements.

CLIENT PRIVACY

Client names and identifying details are anonymized.

DELIVERABLE TYPE

Requirements baseline, traceability, assumptions, risks, and delivery handoff.

TYPICAL BUYER

Product owners, delivery leads, transformation teams, and consulting firms.

SITUATION

The project had business intent, but no stable requirements baseline.

Stakeholders had shared notes, process fragments, and policy constraints. Delivery teams needed a clear requirements baseline before sprint planning, vendor estimation, and signoff.

PRIMARY ISSUE

Scope was scattered across notes, emails, and workshop outputs.

BUSINESS RISK

Delivery could start before assumptions, exceptions, and ownership were clear.

CLARITY INDEX

The package moves the work from unclear input to a delivery ready baseline with manageable open questions.

REQUIREMENTS CAPTURED

42

Business, functional, and non functional requirements.

OPEN QUESTIONS

18

Grouped by decision owner and delivery impact.

HIGH RISK GAPS

7

Raised before development work begins.

TRACEABILITY LINKS

31

Mapped to goals, rules, and process steps.

Use this pack as the requirements baseline for estimation, backlog shaping, vendor alignment, and business signoff.

Requirements baseline with business value, acceptance signal, and delivery notes.

The table structure keeps requirements precise enough for delivery, while still readable for business stakeholders.

ID	REQUIREMENT	TYPE	ACCEPTANCE SIGNAL	DELIVERY NOTE
BR 01	The system must capture the business reason for each submitted request.	Business	Reason is visible in request summary.	Supports triage and reporting.
BR 02	Users must be able to save a request before all supporting files are ready.	Business	Draft status is available.	Avoids lost work.
BR 03	Each request must identify target audience and expected decision use.	Business	Audience and output purpose are mandatory.	Improves output fit.
FR 01	The intake form must support multiple file uploads in one submission.	Functional	PDF, Word, Excel, PowerPoint, PNG, and JPG accepted.	Store file records by request.
FR 02	A request must show status, expected credit use, due target, and next action.	Functional	Dashboard row displays all fields.	Client and admin see same state.
FR 03	Admin users must be able to mark a deliverable delivered and record credits used.	Functional	Credit ledger updates after delivery action.	Prevents manual credit drift.
FR 04	Clients must see payment and credit history in the workspace.	Functional	History tables display purchase and usage events.	Improves trust and transparency.
NFR 01	Client files must remain private to the client workspace and authorized operations users.	Non functional	Access checks prevent cross workspace access.	Requires storage policy review.
NFR 02	Every credit change must produce an audit event.	Non functional	Ledger and audit row created for each change.	Supports dispute review.
NFR 03	Low credit reminders must be sent when balance reaches threshold.	Non functional	Email event is logged.	Threshold defaults to two credits.
BR 04	A request with insufficient credits must pause before delivery work proceeds.	Business	Paused status appears to client.	Top up path is shown.
FR 05	Custom scope requests must capture goals, budget range, country, company type, and pain points.	Functional	Custom request appears in admin queue.	Used for proposal follow up.

How this creates value

- Creates a shared language between business, delivery, and vendors.
- Makes assumptions explicit before development spend increases.
- Improves backlog quality and reduces rework.
- Supports signoff with a clear requirements baseline.

What this prevents

- Starting delivery from scattered notes.
- Losing decisions in email threads.
- Treating policy exceptions as late defects.
- Confusing business requirements with technical design.

Requirements decision matrix.

Requirements are grouped by business value and delivery certainty so leaders can resolve the right items first.

PRIORITY	DECISION NEEDED	OWNER
1	Confirm minimum intake fields before request acceptance.	Business owner
2	Agree which requests consume one credit versus custom scope.	Operations lead
3	Confirm file access rules for client and admin users.	Security owner
4	Define refund, credit, and missed target handling.	Commercial owner
5	Confirm email notification language and trigger thresholds.	Operations lead

The strongest requirements packs do not just list needs. They show what must be decided, who owns it, and what delivery risk remains.

Open questions, assumptions, and delivery controls.

This section separates requirements from unresolved decisions so delivery teams do not mistake unknowns for approved scope.

THEME	RISK OR QUESTION	IMPACT	RECOMMENDED ACTION
Credit model	Some larger outputs may exceed one credit.	Billing friction	Confirm credit estimate before work starts.
File quality	Uploaded notes may be incomplete or duplicated.	Analysis delay	Use minimum input checklist.
Stakeholder access	Decision owners may not be available.	Open questions linger	Assign named owner for each question.
Security	Client files may contain sensitive material.	Privacy risk	Use private workspace and NDA where needed.
Turnaround	Clock depends on complete inputs.	Expectation mismatch	State target timing after intake completeness check.
Traceability	Rules may not map cleanly to user stories.	Defect risk	Maintain traceability from rule to requirement.

Quality gate

- Completeness check
- Ambiguity review
- Risk review

Client gate

- Open question signoff
- Priority confirmation
- Scope boundary

Delivery gate

- Backlog readiness
- Acceptance criteria
- Traceability

Requirements handoff roadmap.

STEP 1

Intake

- Collect files
- Confirm goal
- Identify audience

STEP 2

Structure

- Group requirements
- Separate gaps
- Map business rules

STEP 3

Validate

- Review assumptions
- Confirm priorities
- Resolve blockers

STEP 4

Handoff

- Package baseline
- Prepare signoff view
- Support delivery planning

Decision log

DECISION	RECOMMENDATION	STATUS
Scope baseline	Use this pack as the controlled baseline.	Approve
Open questions	Assign owners before sprint planning.	Action
Credit use	Confirm multi credit items before delivery.	Control
Vendor handoff	Share only approved baseline and assumptions.	Ready

Open questions

- Which requirements are mandatory for launch?
- Which policy exceptions are in scope?
- Who approves open business rules?
- What must be deferred to later phases?

The output gives teams a clean baseline for signoff, planning, vendor discussions, and future traceability.
